35 Effect of the Invention

The compounds of the present invention show high affinity to a benzodiazepine receptor. The drugs bound to this receptor are classified as three groups according to the difference of the efficacy. Thus, agonists can be utilized as anxiolytics or anticonvulsants, antagonists can be agents for treating benzodiazepine intoxication and accidental supernumerary uptake, and inverse agonists are expected as psychostimulants.

40 Experiments for assessing biological activities of the compounds of the present invention are shown below; the number of the test compound nearly corresponds to the number used in Examples and Tables respectively.

45

Experiment 1

Binding test to benzodiazepine receptor

50

This test was carried out in the modified method of Möhler et al. Science, 198, 849-851 (1977).

Receptor preparation was provided from the cerebral cortex of Wistar rats (male, 11 to 13 weeks age). Inhibitory action of the test compound on the specific binding of tritium labeled diazepam to the receptor was evaluated as follows. 2nM tritium labeled diazepam and an aqueous solution of the test compound at 5 or 6 concentrations were incubated with the receptor preparation at 0°C for 6 minutes. The 50% inhibitory concentration ( $IC_{50}$ ) was measured by the concentration-response curve.

55 The inhibitory constant ( $K_i$ ) was calculated according to the following equation, in which  $K_d$  is the dissociation constant of the tritium labeled diazepam and  $L$  is the concentration of the labeled ligand.

$$K_i = \frac{IC_{50}}{1 + L/K_d}$$

## Traction test

30

The modified method of Courvoisier et al. (in "Psychotropic Drugs", ed. by S. Garattini & R. Ducrot. p 373. Elsevier Publishing Co., Amsterdam 1957) was employed. Groups of 10 mice were made to hang onto a horizontal metal wire (diameter : 1 mm) by grasping and holding with their forepaws 30 minutes after oral administration of the test compound, and the number of mice gripping the wire with hindpaws within 10 sec was counted. The ED<sub>50</sub> was calculated by the probit method.

## Experiment 5

## Anticonflict test

45

The modified method of Geller and Seifter (Psychopharmacol, 1, 482, 1960) was employed. Groups of 5 or more male Wistar rats with well-established conflict behavior were used. A dose was determined as positive when the number of electric shocks (punishment) exceeded more than 12 during a 1-hour observation period starting 30 minutes after oral administration of the test compound. The ED<sub>50</sub> was calculated by the probit method.

The pharmacological activities described above suggest that the dissociation of anxiolytic action and muscle relaxation action, both being specific to drugs of benzodiazepine type, was achieved. Thus, the compound of the present invention can be an anxiolytic drug not accompanying with a side effect such as dizziness.
